

Online Shop Performance Report

Prepared for Nontokozo Mthimunye

This analysis evaluates shop performance from January 2024 to June 2026. The data reveals three critical insights: Electronics drive the vast majority of our revenue, Tehran is our undisputed primary market, and zero-discount transactions yield the highest overall financial returns.

Key Findings & Insights

- Category Dominance:** Electronics generate the vast majority of revenue at approximately 1.62M, completely dwarfing secondary categories. Following Electronics are Accessories (517.51K), Home Office (416.55K), Wearables (404.54K), Gaming (184.49K), and Stationery (61.84K). This signifies that our customer base primarily views the shop as a tech destination rather than a general goods store.

Category by Revenue

Figure 1: Category Dominance

- **Geographic Concentration:** Tehran acts as the central revenue engine, bringing in roughly 879,92k. This is more than double the contribution of our second-best performing city, Mashhad 404,02k

Figure 2: Geographic Concentration

- **Customer Base Value:** Regular customers are the financial backbone of the business, contributing 55.6% of total revenue. New customers represent a healthy acquisition rate at 34.7%, while the VIP segment remains largely untapped at just 9.71%.

Revenue Contribution by Customer Segment

Figure 3: Revenue contribution by Customer segment

- **Discount Impact:** Revenue peaks when no discount is applied (0% yields ~1.2M) and drops consistently as the discount percentage increases. At a 5% discount, revenue falls to 718.73K, followed by 10% (627.73K), 15% (354.96K), and 20% (203.18K). Revenue hits 0K at a 25% discount before a slight bump to 100.61K at a 30% discount. Bigger discounts are heavily eroding our revenue rather than making up for the price cut through higher transaction volume.

Total Revenue by Discount Percentage

Figure 4: Total Revenue by Discount Percentage

- **Payment Reliability:** Transaction completion rates remain exceptionally high across all payment types, meaning payment method friction is not a current business bottleneck. The breakdown by method shows:
- **Card to Card:** 92.12% completed, 2.80% returned, 5.20% cancelled
- **Cash:** 92.12% completed, 3.04% returned, 4.84% cancelled
- **Gateway:** 91.90% completed, 3.22% returned, 4.86% cancelled
- **Wallet:** 91.89% completed, 3.02% returned, 5.08% cancelled
- **Unknown:** 94.22% completed, 2.67% returned, 3.11% cancelled

Payment Method Performance by Transaction Status

Figure 5: Payment Method Reliability

- **Revenue Fluctuations:** The shop experiences its most significant revenue spike in January (roughly 342.93K) and hits a secondary seasonal high in May (315.98K). Conversely, revenue sees a notable dip in the mid-year, bottoming out around July (232.28K).

Strategic Recommendations

- 1. Restructure the Discount Strategy:** Because higher discounts correlate directly with lower total revenue, we should scale back discounting. Reserve strategic price cuts strictly for clearing out low-performing inventory (such as Stationery or Gaming) rather than unnecessarily discounting high-demand Electronics.
- 2. Localize High-Value Marketing:** Double down on our strongest geographic market by concentrating advertising spend and prime inventory distribution in Tehran, where customer demand is proven and highly lucrative.
- 3. Develop a VIP Conversion Pipeline:** With Regular and New customers making up over 90% of our revenue, we have a massive opportunity to create targeted loyalty incentives. Moving high-frequency Regular shoppers into the VIP tier will increase their lifetime value and drive more predictable recurring revenue.
